An Inventory Management Service

Inventis Associates provides an Inventory Management Service designed to:

- Reduce inventory values
- Improve customer service levels
- Enhance existing purchasing systems

Our service operates by:

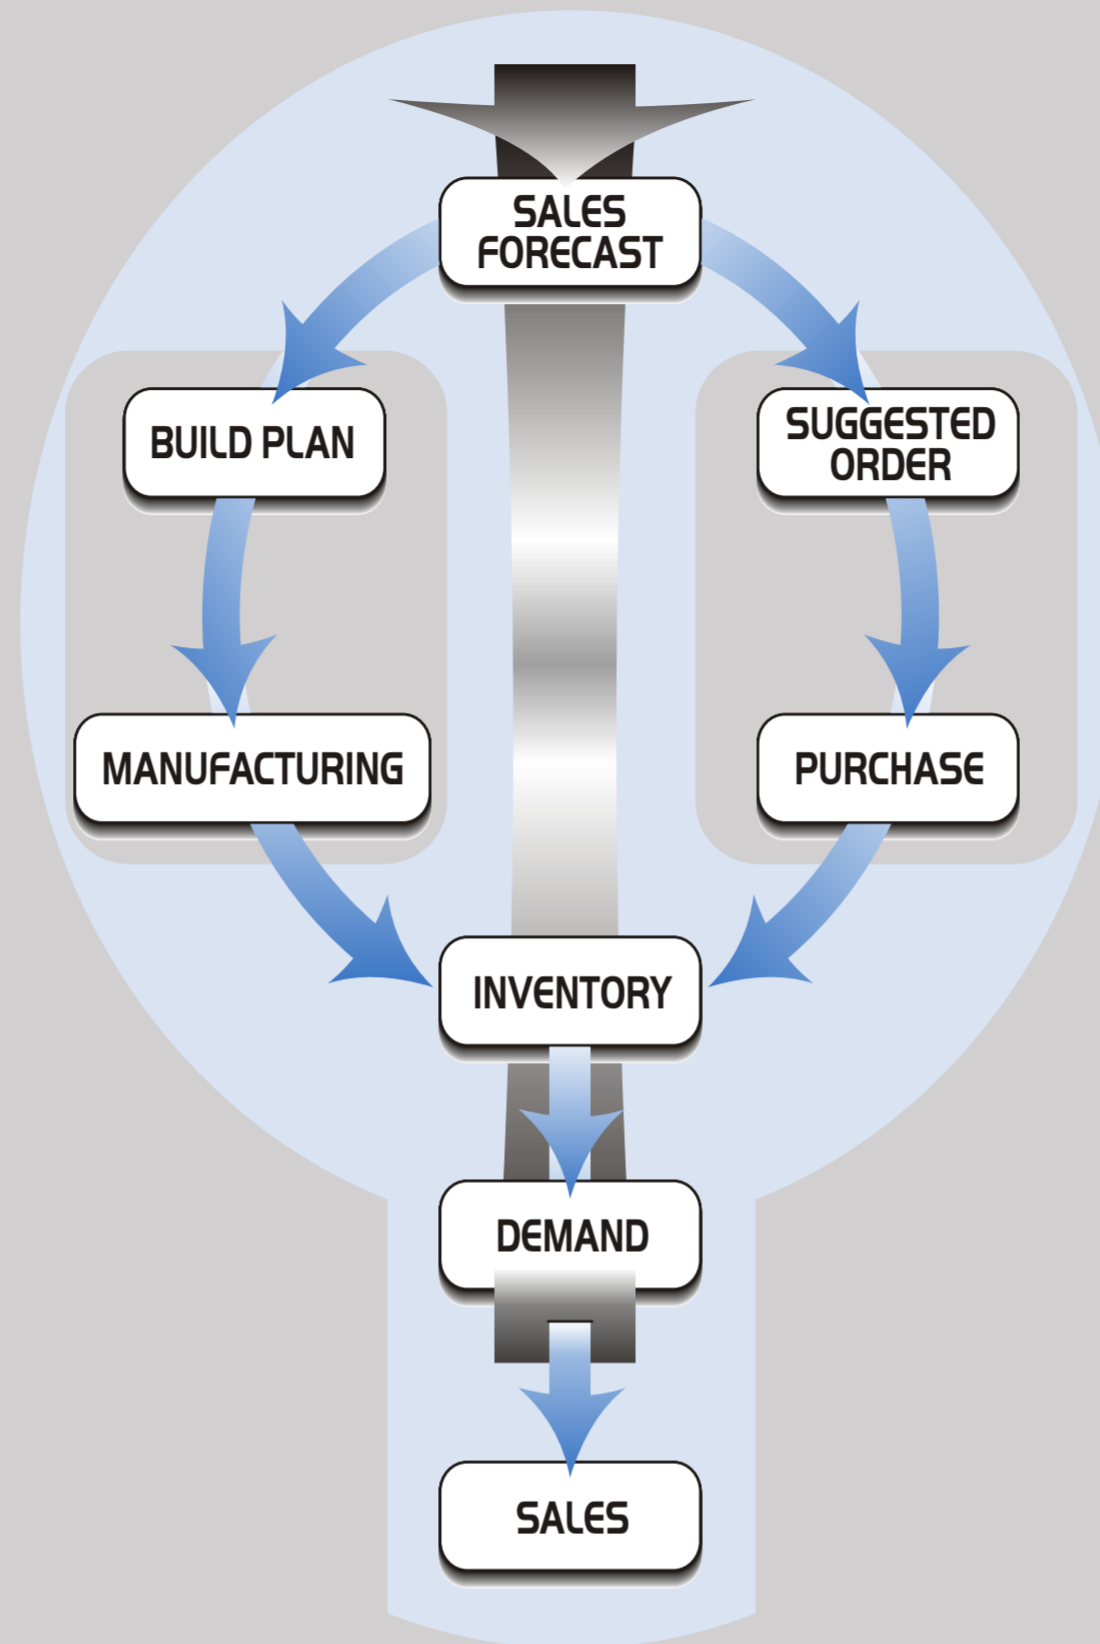

- Establishing a database of the client's demand history for each item in the inventory
- Updating this database at monthly intervals
- Forecasting demand for each item using rigorous statistical modelling techniques
- Combining other client-provided data to provide an output format tailored to the client's needs and purchasing systems

The client then uses this output initially to inform their purchasing systems and, as confidence grows, to integrate the forecast output as a primary method for purchasing and inventory control decisions.

The Inventis service removes the need for extensive IT investment, personnel training and system development. It provides a structured basis for planning forecasts, routine inventory replenishment or input to manufacturing systems.

Inventis Associates can offer a low-cost service which allows small companies the benefit of forecasting software without the need for in-house IT skills or large investment in time and software.

During a free trial period Inventis will produce sample reports for companies, tailored to their particular application. This will enable assessment of the validity and value of the information provided by Inventis. There is no financial commitment whatsoever at this stage.

Inventis Associates offers its clients the opportunity to capitalise on years of experience within the manufacturing, commercial, retail and wholesale industries.

In our experience, very few businesses in today's fast moving global economy have the opportunity to step aside and analyse all aspects of their organisation.

Improvements in efficiency and performance are required continually and in all areas to remain competitive; whether it be sales strategy, customer service & satisfaction, productivity, distribution, stockholding and information technology to name just a few.

Inventis Associates offer their clients assistance in this difficult task and will work with your organisation with the common aim of continuous improvement.

Focusing primarily on the inventory management within your organisation, Inventis Associates works alongside your sales, purchasing and inventory departments with the aim of optimising your company's control of what often appears to be unpredictable order forecasting. Whether it be for finished product or spare parts, the detailed consultancy and ongoing analysis offered by Inventis Associates will enable your organisation to focus its efforts on the key issues and areas, with the end result of improved customer service and optimised re-order and stocking levels.

How? Well we do not claim to be able to predict the future, but our skill is in analysing the past and assessing the present to forecast the most probable future.

In detail, we analyse your sales history, product-by-product, whether you have a 1000 order lines or 1,000,000 and use it to generate a statistical model of the future, one for each individual product. Then by adding in the present inventory we are able to generate a proposed order schedule. As time goes by, and the history for each product grows, so the accuracy of the model grows with it and the optimisation continues.

Does this apply to your organisation? Well, does your company have any concerns with back orders or overstocking? Or more to the point, does your organisation know if it has? And how much is it costing? Start a partnership with Inventis Associates and take control of your inventory.
